

UNIDO

Background:

The United Nations Industrial Development Organization is a branch of the UN that promotes industrial development worldwide focusing on reducing poverty and maintaining environmental sustainability. UNIDO is interested in exploring how key indicators of industrial development correlate with the UN's official Sustainable Development Goals (SDGs). This project will continue the work of HUDAG's case team from last semester to calculate relationships between these industrial development indicators and progress towards the SDGs and validate the strengths of relationships as reported in economic literature. Results will be presented in an interactive visualization and potentially presented to multiple divisions of UNIDO.

Goal: Explore impact of industrial development indicators on progress towards sustainable development goals.

Skills: Data Analysis, Regression Analysis, Visualization, Research
